The labyrinthine patterns, gyri & sulci, of the cerebral cortex of a human brain:  
(a) dorsal view; (b) lateral view.

## **Reaction–diffusion equations and Turing patterns**

To model pattern formation, Turing proposed an interaction between two diffusing biologically active chemical species.

One of the species inhibits growth, and the other enhances it.

At the same time, **they interact to activate and inhibit** each other.

- J. H. E. Cartwright, “Labyrinthine Turing pattern formation in the cerebral cortex”, J. Theor. Biol. **217**, 97–103, 2002
- Collected Works of A. M. Turing: Morphogenesis (P. T. Saunders, editor), North-Holland, 1990

### A simple reaction-diffusion system:

$$\frac{\partial u}{\partial t} = \nabla^2 u + F(u, v)$$
$$\frac{\partial v}{\partial t} = \delta \nabla^2 v + G(u, v)$$

- $u$  and  $v$  are the concentrations of the two diffusing and reacting chemical species (say,  $u$  the activator and  $v$  the inhibitor)
- $F(u, v)$  and  $G(u, v)$  represent the chemical process
- Even if you start from nicely mixed and homogenous solutions, the system may become unstable if  $\delta > 1$  i.e. when the inhibitor diffuses more rapidly than the enhancer

**The chemistry:**

$$F(u, v) = \gamma(v - \frac{u^3}{3} + u)$$

$$G(u, v) = -\gamma^{-1}(u + \lambda + \beta v)$$

$\gamma$  determine the interaction kinetics: for  $\gamma < 1$  inhibition dominates, whereas for  $\gamma > 1$  activation dominates.

Note that  $\gamma$  is connected with local reaction characteristics whereas  $\delta$  quantifies how the two species diffuse.

$\beta$  and  $\lambda$  determine the type of equilibrium states of the local dynamics

$\nabla^2 u$  The Laplacian

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} + \frac{\partial^2 u}{\partial z^2}$$

$$\frac{\partial u}{\partial x} = \frac{u_{i+1} - u_i}{\Delta x} \dots as \dots \Delta x \rightarrow 0$$

$$\frac{\partial^2 u}{\partial x^2} = \frac{\left( \frac{u_{i+1} - u_i}{\Delta x} \right) - \left( \frac{u_i - u_{i-1}}{\Delta x} \right)}{\Delta x} = \frac{u_{i+1} - 2u_i + u_{i-1}}{\Delta x^2} \dots as \dots \Delta x \rightarrow 0$$

**The temporal derivative:**

$$\frac{\partial u}{\partial t} = \frac{u_{t+\Delta T} - u_t}{\Delta T} \dots as \dots \Delta T \rightarrow 0$$

**Issues to consider:**

Let us think about the 1D case for a second:

$$\frac{u_{t+\Delta T} - u_t}{\Delta T} = \frac{u_{i+1} - 2u_i + u_{i-1}}{\Delta x^2}$$

WHERE IS  $u_t$  and WHEN is  $u_i$  ???

### Option 1: Explicit scheme

$$\frac{u_i^{t+\Delta T} - u_i^t}{\Delta T} = \frac{u_{i+1}^t - 2u_i^t + u_{i-1}^t}{\Delta x^2}$$

Intuitive consideration:  
What do they mean  
as far as my choice  
for time step?

### Option 2: Implicit scheme

$$\frac{u_i^{t+\Delta T} - u_i^t}{\Delta T} = \frac{u_{i+1}^{t+\Delta T} - 2u_i^{t+\Delta T} + u_{i-1}^{t+\Delta T}}{\Delta x^2}$$

## Implications:

- Stability

- Implicit schemes are much more stable (often unconditionally stable)

- Simplicity

- Explicit schemes are often very easy to program
  - Implicit schemes require the solution of a linear system
  - Implicit schemes for non-linear problems require the solution of a linear system many many times!

- Speed & Memory

- Implicit schemes require more memory
  - Explicit schemes are much easier to parallelise

- Accuracy

- The two often have different requirements in terms of discretization, attention to detail is important

In our case the explicit scheme would read:

$$\frac{u_{i,j}^{t+\Delta T} - u_{i,j}^t}{\Delta T} = \frac{u_{i+1,j}^t - 2u_{i,j}^t + u_{i-1,j}^t}{\Delta x^2} + \frac{u_{i,j+1}^t - 2u_{i,j}^t + u_{i,j-1}^t}{\Delta y^2}$$

Exercise: do the algebra and get the unknown explicitly.

### **Other issues:**

- Boundary conditions
- Initial conditions
- Other difference schemes
- Different topologies
- Different equations

# “The Grid”

## Grids and Computing: a Tangent in the storyline

The American Whirlwind, built in the mid-1940s. Based on thermionic tubes - valves, used to solve problems of aircraft flight performance. The switch from tubes to transistors (1950s), reduced the size of state-of-the-art computers from 2 huge rooms to 1.

Monitor and mouse not included

- 20 MHz Intel® 80386™ Microprocessor ■ VGA Graphics
- 2 MB RAM (16 MB Capacity) ■ Cache Memory

Our most powerful computer ever! The Tandy 5000 MC Micro Computer is strictly business, from the look of its 256,000-color VGA graphics to the tactile feel of its newly-designed keyboard. Its Intel 80386 processor operates at a lightning-fast 20 MHz, and a memory cache controller provides RAM-fast access to your data. IBM® Micro Channel™ compatible architecture provides a 32-bit wide data path for virtually simultaneous data transfer between peripherals. Will operate MS-DOS® 3.3, MS® OS/2, SCO® XENIX® 386 and network operating software. The 5000 MC's technology, performance and price all add up to an incredible value. VGA graphics, serial and parallel ports and mouse support included.
